Guide to Information Sources in Engineering Nov 22 2021 The only source that focuses exclusively on engineering and technology, this important guide maps the dynamic and changing field of information sources published for engineers in recent years. Lord highlights basic perspectives, access tools, and English-language resources--directories, encyclopedias, yearbooks, dictionaries, databases, indexes, libraries, buyer's guides, Internet resources, and more. Substantial emphasis is placed on digital resources. The author also discusses how engineers and scientists use information, the culture and generation of scientific information, different types of engineering information, and the tools and resources you need to locate and access that material. Other sections describe regulations, standards and specifications, government resources, professional and trade associations, and education and career resources. Engineers, scientists, librarians, and other information professionals working with engineering and technology information will welcome this research

School Choice Or Best Systems Jun 29 2022 This book addresses one of the most urgent questions in American society today, one that is currently in the spotlight and hotly debated on all sides: Who shall rule the schools--parents or educators? School Choice or Best Systems: What Improves Education? presents an overview of research and practical applications of innovative--even radical--school reforms being implemented across the United States. These fall along a continuum ranging from "parental choice" to "best systems." At the one extreme are schools of choice, which allow parents to choose and even govern schools for their children. These include charter schools, traditional private and parochial schools, schools that are privately governed but publicly funded through vouchers, and those that are funded by private scholarships provided by both corporations and wealthy individuals. At the other extreme are centralized state or district systems, based on reform initiatives and new systems of education that have been developed in response to views of citizens and legislators that schools can do much better. These schools, which specify uniform goals, policies, and programs for each school, are highly innovative systems based on research or representing advanced thinking about "what works," and have attracted wide interest. Important questions related to schools of choice and best systems are addressed: How can we choose among schools of choice and best systems? Among the various approaches within each of these alternatives? How can we understand their guiding principles and operational practices? What results do they produce? How can we evaluate their claims? In choosing among the alternatives, how should issues of student achievement, accountability, costs, feasibility, and equity be factored in? This volume brings together leading researchers and education leaders who have carried out the latest studies and advances in the field, providing a forum for them to set forth the arguments and evidence that will be most helpful in making choices for tomorrow's schools. It does not provide a single "right" answer--values and preferences differ across parents, schools, districts, and states. However, there are benefits for all from seeing the rigorous research, challenging thinking, and alternate points of view this volume presents.

Supplementary Material and Solutions Manual for Mathematical Modeling in the Environment Sep 20 2021 This manual is meant to provide supplementary material and solutions to the exercises used in Charles Hadlock's textbook, Mathematical Modeling in the Environment. The manual is invaluable to users of the textbook as it contains complete solutions and often further discussion of essentially every exercise the author presents in his book. This includes both the mathematical/computational exercises as well as the research questions and investigations. Since the exercises in the textbook are very rich in content, (rather than simple mechanical problems), and cover a wide range, most readers will not have the time to work out every one on their own. Readers can thus still benefit greatly from perusing solutions to problems they have at least thought about briefly. Students using this manual still need to work out solutions to research questions using their own sources and adapting them to their own geographic locations, or to numerical problems using their own computational schemes, so this manual will be a useful guide to students in many course contexts. Enrichment material is included on the topics of some of the exercises. Advice for teachers who lack previous environmental experience but who want to teach this material is also provided and makes it practical for such persons to offer a course based on these volumes. This book is the essential companion to Mathematical Modeling in the Environment.
